Theorem. (Euclid) 程序代写代做 CS编程辅导

There are infinitely many prime number

Proof.

Suppose, by way of contradice the state only finitely many primes.

Let *n* be the number of primes.

Let p_1, p_2, \dots, p_n be all the primes. We Chat: cstutorcs

Define: $q := p_1 \cdot p_2 \cdot \cdots \cdot p_{\text{posstgr}}$ ment Project Exam Help

This is bigger than every prime p_i . Therefore \ddot{q} must be composite.

Therefore q is a multiple of some prime tutores@163.com

But, for each prime p_i , if you divide p_i by p_i you get a remainder of 1.

So q cannot be a multiple of p_i .

So q cannot be a multiple of anytherimetornis as a contradiction.

So our initial assumption was wrong.

So there are infinitely many primes.

Theorem. (Pythagoras) $\sqrt{2}$ is irrational.

程序代写代做 CS编程辅导

Proof.

Suppose, by way of contradi $\sqrt{2}$ is rational.

Then, by definition, there exist positive integers m, n such that $\sqrt{2} = \frac{m}{n}$.

Among all such pairs m, n, chowe a limit to have no common factors.

Squaring each side of our equation gives: $2 = \frac{m^2}{\text{Assignment Project Exam Help}}$ Rewrite slightly: $2n^2 = m^2$.

This tells us that m^2 is even. Therefore words evens. Therefore m=2k for some k.

Substituting this back in gives: $2n^2 = (2k)^2$, i.e., $2n^2 = 4k^2$, i.e., $n^2 = 2k^2$. This tells us that n^2 is even. Therefore n is even.

Since m and n are both even, they both the vecare ommon factor, namely 2.

But we chose them so that they have no common factors. This is a contradiction.

Therefore our initial assumption, that $\sqrt{2}$ is rational, must be wrong.

Therefore $\sqrt{2}$ is *irrational*.

Definition: A set is countable if either 做 CS编程辅导

- ▶ it is finite, *or*
- \blacktriangleright it can be put in one-to-one independence (i.e., bijection) with \mathbb{N} .

Theorem. (Cantor) 程序代写代做 CS编程辅导 The set of all languages is uncountable.

Idea of proof: If {all language countable ...

Theorem. (Cantor)

程序代写代做 CS编程辅导

The set of all languages is uncountable.

Proof. Suppose, by way of countable.

Since we know it's not finite, the bear bijection between \mathbb{N} and $\{\text{all languages}\}$.

Let the members of the set of all languages be L_m , $m \in \mathbb{N}$.

Recall that the set of all finite strings as countered, so we can list them as x_n , $n \in \mathbb{N}$. Define the language \hat{L} as follows:

Assignment Project Exam Help

VIII 6 2N : txto Ec LO + 680 Catho.

We have constructed \hat{L} so that $G_{\hat{k}}$: $G_{\hat{$ contains x_n .

So it differs from all languages. Yet it is a language! This is a contradiction.

So our initial assumption was wrong.

So the set of languages is uncountable.

"Theorem": Every graph has程序次码写代做 CS编程辅导 For all n: every graph on n vertices has a cycle.

This implies that trees do not ϵ

"Proof". We prove this by ind the number of vertices.

- 1. Assume that every graph tices has a cycle.
- 2. Let G be any graph on n+1 vertices. We Chat: estutores
- 3. Let v be a vertex of G. Obtain the graph G v by removing v, and all its incident edges, from G. Assignment Project Exam Help
- 4. Now, the graph G v has Physrtices a 163.com
- 5. By the **Inductive Hypothesis**, G = v has a cycle.
- 6. But, since G v is a subgraph of G, any cycle in G v is also a cycle in G.
- 7. Therefore G has a cycle. https://tutorcs.com
- 8. Therefore, by Mathematical Induction, the result is true for all *n*. So every graph has a cycle.

程序代写代做 CS编程辅导

Definition: A string is *unifor* s letters are identical.

- i.e., it consists entirely of as or entirely of bs WeChat: cstutorcs
- ▶ i.e., it's either aa···a or bb···b

Now, it is commonly thought that isomorphist the strong of the strong of

QQ: 749389476

https://tutorcs.com

- "Theorem": Every string over the alphabet (ab) is uniform.
- "**Proof**". We prove this by induction on the string length n.
 - 1. Inductive basis: when $n = \mathbb{E}$ ing can only be "a" or "b", and these are each of the required form, ** heorem" is true in this case.
 - 2. Now assume $n \ge 2$, and sum ery string of length n is uniform.
 - 3. Let w be any string of length n+1.
 - 4. Let w_1 be the string obtain obtain out that w_2 that w_3 be the string obtain out that w_2 the w_3 be the string obtain out that w_3 is the w_4 be the string obtain out that w_4 is the w_4 be the string obtain out that w_4 is the w_4 be the string obtain out that w_4 is the w_4 be the string obtain out that w_4 is the w_4 be the string obtain out that w_4 is the w_4 be the string obtain out that w_4 is the w_4 because w_4 is the $w_$ be the string obtained from w by deleting the last letter of w. 5. Both w_1 and w_2 are of length n.

 - 6. By the Inductive Hypothes smagthurgrand 1662 must be uniform.
 - 7. w_1 and w_2 overlap in n-1 letters. Since n-1>0, this means that the number of letters shared by w_1 and w_2 is nonzero. So w_1 and w_2 must each consist entirely of the same letter, hereby both consist entirely of as or they both consist entirely of bs.
 - 8. It follows that w also consists entirely of as or entirely of bs, so it is uniform too.
 - 9. The result follows for all n, by Mathematical Induction.

Ugly proofs

Theorem.

程序代写代做 CS编程辅导

 $DOUBLEWORD \subseteq EVEN-EVEN$

Proof. Let $w \in \mathsf{DOUBLEWOl}$

Assume w is not in EVEN-EVEN.

Then w = xx for some word x. WeChat: cstutorcs

So, # a's in $w = 2 \times (\#$ a's in x), so it's even. Also, # b's in $w = 2 \times (\#$ b's in x), so it's even too

This contradicts our assumption in the contradict of the contradiction in the co

Therefore that assumption was wrong.

Therefore $w \in \text{EVEN-EVEN}$. QQ: 749389476

https://tutorcs.com

When you have a *direct* proof of your theorem, there's no need to dress it up as a proof by contradiction!

Ugly proofs?

A **colouring** of a graph G is a function that assigns a good ur to each vertex of G such that adjacent vertices receive different colours.

• i.e., a function
$$f: V(G) - \mathbb{R}$$
 such that $\forall u, v \in V(G): u \sim v \Rightarrow f$

A colouring is a k-colouring if the number of colours used is $\leq k$. We Chat: cstutorcs
